

## THE BIRD'S EYE VIEW

**1** The bird's eye view is a perspective from above, looking down at the scene. This view is often used in nature photography to show the bird's position relative to its environment. It can be achieved by shooting from a high angle, looking down at the bird. This view is useful for showing the bird's feet, the ground it is standing on, and any objects or structures nearby. It can also be used to show the bird's flight path or its position in a group. The bird's eye view is a common and effective way to capture a bird in its natural habitat.
